

Item no.: T60404-N4641-X925

Differential Current Sensor with tripping characteristic of IEC62955

Date: 11.10.2021

K-No.: 30286

Customer: Standard type Page 1 of 6

Description

Fluxgate current sensor with toroidal core

· PCB mounting

Characteristics

- · Excellent accuracy
- AEC-Q qualified components
- · Switching open-collector outputs
- Compact design

Patents: EP2571128 / US9397494 / CN103001175 // EP2813856

Applications

Mainly used for stationary applications:

Wallbox

Electrical data	<u>– Ratings</u>	min.	typ.	max.	Unit

 $^{^{(3)}}$ Switching time of a standard relay (t = 20ms) is considered.

General description of sensor function:

The sensor is sensitive to DC currents and can be used for fault current detection in EV-charging applications according IEC 62955:2018. In the event of a DC fault current, PIN3 and PIN4 will change its state from a low level to a high impedance state.

Error conditions (e.g. an internal error) are signaled on PIN 1 (ERROR-OUT).

The sensor only fulfills the switch-off characteristic of the IEC62955 standard (monitoring the residual current). An additional driver-circuit must be used for driving RCBO, RCCB or circuit breaker as defined in IEC62955. The sensor's outputs are limited to max. 40V/50mA!

⁽⁴⁾ see VAC M-sheet 3101; storage temperature inside cardboard packaging.

⁽⁵⁾Can only be achieved with the isolator; all values acc. to applied standards.

⁽⁶⁾ Designed, manufactured and tested in accordance with IEC60664-1:2007. The isolation coordination is according to: Reinforced insulation, Insulation material group 1, Pollution degree 2, altitude ≤ 5500m and overvoltage category III.

⁽⁷⁾ The results are valid under following conditions: 55°C mean component ambient temperature by continuous operation (8760h per year); Environment condition: ground mobile, no dust or harmful substances, according to IEC61709; Fit equals one failure per 10^9 component hours.

PIN no.	Description
PIN 1 → ERROR-OUT (open collector output)	If no system fault is detected, the output PIN 1 is a low level (GND). If a system fault is detected, PIN 1 is high impedance. In this case, PINs 3 and 4 will be set to a high impedance state (see tab. 1).
	A function test including an offset measurement (this value is stored in EEPROM for further calculation) is activated if this PIN is connected to GND for a period of 40ms to 1.2s.
PIN 2 → TEST-IN (refer to Fig. 2)	Attention: During the functional test and offset measurement, no differential current may flow.
	To ensure high accuracy of the sensor this test should be activated at regular intervals (e.g. at startup, before measuring).
	If a push-pull switch is used, the voltage range must be 0V5V.
PIN 3 → X6-OUT (open collector output)	If the residual current is below DC 6mA and no system fault occurs the output on PIN 3 is a low level (GND). In any other case output PIN 3 is in a high impedance state.
PIN 4 → X30-OUT (open collector output)	If PIN 3 is high impedance, PIN 4 will also be set to high impedance (see tab. 1).
PIN 5 → GND	Ground connection
PIN 6 → VCC	Positive supply voltage
PIN 7 → PWM-OUT	Acc. to the DC component of residual current a duty-cycle with f=8kHz is generated. This is for monitoring purposes only and is not safety function! Refer to Spwm-Out = 3.33%/mA
PIN 8 → N.C.	Not connected
PIN 9 – 16	For primary wires connection

Typical application diagram:

Absolute maximum ratings(8):

		Min	Тур.	Max	Unit
V _{CE}	Collector-Emitter voltage (PINs 1, 3 and 4)			40	V
Ic	Collector current (PINs 1, 3 and 4)			50	mΑ
Vcc	Maximum supply voltage (without function)	-0.3		7	V
U _{MAX}	Maximum rated voltage of primary conductors			440	V
VTEST-IN, high	TEST-IN Input Voltage, high level	0		0.6	V
V _{TEST-IN, low}	TEST-IN Input Voltage, low level	2.5		5	V

(8) Stresses above these ratings may cause permanent damage. Exposure to these conditions for extended periods may degrade device reliability. Functional operation of the device at these or any other conditions beyond those specified is not supported.

^{*} IEC 61800-5-1:2007

Other instructions:

- Temperature of the primary conductor should not exceed 105°C.
- Vcc during Test-IN function test must be at least 4.8V
- Fall- and rise-time of Vcc 2...50μs/V

Figures:

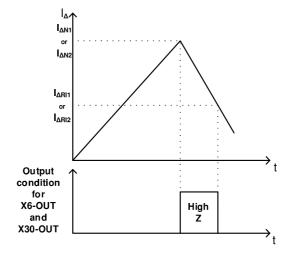

Fig. 1: Meaning of switching recovery level

If the trip-level $I_{\Delta N1}/I_{\Delta N2}$ is accomplished the outputs X6-OUT/X30-OUT will change their state from low-level (GND) to high impedance. Depending on the existence of the residual current I_{Δ} , the outputs X6-OUT/X30-OUT will remain in this state until I_{Δ} falls below the threshold $I_{\Delta R11}/I_{\Delta R12}$.

Page 6 of 6

t1 = 10ms or 100ms

Optional time to check for welded contacts.

10ms if check is disabled.

t2 = 500ms

t3 = 0ms to 50ms

Time for offset calibration (if it was requested).

Optional time required to store the offset

calibration value. Depends on the difference to the

value already stored in memory.

Fig. 2: Power-Up timing diagram

X6-OUT	X30-OUT	ERROR-OUT	State				
low level	low level	low level	Normal condition				
low level	low level	low level	I∆ < 30mA _{AC}				
High impedance	High impedance	low level	I _∆ ≥ 6mA _{DC}				
High impedance	impedance High impedance F		Error, system fault				
All other conditions not mentioned in the table are not possible. If these							
conditions occur, the sensor is in unknown state and describes an Error.							

Table 4. Describes autout states
