$V_{OUT}(0)^1$	Output voltage @ $I_P=0A$ , $\theta_A=25^\circ C$	$V_{REF} \pm 0.015$	V
$V_{OUT}(\text{Error})$	in case of error (current sensor) $V_{OUT}$ is set	< 0.5	V
$V_{REF}$	internal reference voltage	$2.5 \pm 0.005$	V
	external reference voltage range	1.4...3.5	V

<sup>1</sup> with switching on and after "test current" the sensor is degaussed by an internal AC-current for about 110ms.

In this time the output is set to  $V_{OUT} < 0.5V$ .

<sup>2</sup> If  $V_{REF}$  is set external to 0...0.1V an internal test current is generated.

### Other instructions

- A positive output voltage appears at point  $V_{OUT}$  vs.  $V_{REF}$ , if primary current flows in direction of the arrow.
- Temperature of the primary conductor should not exceed  $105^\circ C$ .
- Housing and bobbin material UL-listed: Flammability class 94V-0.
- Housing without red phosphorous
- Further standards: UL 508, file E317483, category NMTR2 / NMTR8
- The color of the plastic material is not specified and the current sensor can be supplied in different colors (e.g. brown, black, white, natural). This has no effect on the specifications or UL approval
